TO:

Mr. Charles J. Walters Public Health Advisor

ATSDR EPA Region III

FROM:

Kevin Koob, EPA Region III On-Scene Coordinator

Eastern Response Section

SUBJECT:

Diamond State Salvage Site

Wilmington, New Castle County, DE

DATE:

August 16, 1995

1. Identifying Information

Site Name: Diamond State Salvage Site

Site Location: Wilmington, New Castle County, DE

Site Type: Abandoned salvage yard with heavy debris from past operations.

Description of the Problem

Diamond State Salvage operated at the site from 1949 to 1992. During this time, full scale salvage operations consisted of removing salvageable metals from automobiles, appliances, and batteries. Field visits conducted by Delaware Department of Natural Resources and Environmental Control (DNREC) to the site and surrounding areas reveal that extensive contamination of the soils has occurred during the operational history. Much of the property is covered by excavated earth mixed with debris and trash. Results from DNREC soil testing indicate elevated concentrations of lead (i.e. high value = 4360 ppm), polychlorinated biphenyls (PCBs) (i.e. high value = 58 ppm) and polycyclic aromatic hydrocarbon (PAH) (i.e. high value = 21 ppm for benzo-a-pyrene). In June 1995, U.S. EPA OSC Koob tasked the Technical Assistance Team (TAT) to collect samples at the Diamond State Salvage Site. The results from this sampling event revealed high levels of lead and PCBs. There is a potential threat of the lead and PCBs entering the Brandywine Creek through storm water run-off and erosion of the earth bordering the creek.

II. Substances Present

A summary of hazardous substances found at the Diamond State Salvage Site has been attached (See Attachment I,II, & III).

Diamond State Salvage Site August 16, 1995
Page 2

Potential Health Threats

See Attachment IV - Material Safety Data Sheets (MSDS).

III. Geographical and Demographical Data

The Diamond State Salvage Site is located in northern New Cast' 14th Street, between Pine and Church Streets in Wilmington, De western border of the site is the Brandywine Creek. The inacti elongated, triangular-shaped 4.25 acre parcel. The immediate is border of the property is a mixture of vacant lots and buildings an industries. Beyond the immediate boundaries are extensive residential areas. All residents are believed to be on public water private wells are located two miles from the site.

The Diamond State Salvage area is located upstream from extens areas. These wetlands are along the Brandywine Creek, Christi Delaware River.

Surface water from the site flows downgradient and discharge Brandywine Creek. Tidal, marsh and low marsh wetlands are low Brandywine Creek and Christina River 500 feet from the site. The Creek flows in an approximate south-southeastern direction to 1 River 1.4 miles from the site. The Christina River flows into the De 3.2 miles from the site. Both bodies of water are used for refishing.

IV. Relationship to Nearby Community

The site is located in a residential/industrial area of northern New C on 14th Street, between Pine and Church Streets in Wilmingtor The western side of the property is bordered by Brandywine Cre which encloses the property, as well as three locked gates at the entrances, provide semi-restricted access. The fence and gates is in several areas, allowing enough room for a person to trespass approximately 1469 individuals residing within 1/4 mile of the educational facilities, an elementary school, a vocational-technica and daycare center, are located within 250 feet of the site. The population within 1 mile of the site is 28,552. A total of 123,07 reside within a 4-mile radius of the site.

Diamond State Salvage Site August 16, 1995
Page 3

V. Site History

Diamond State Salvage operated at the site from 1949 to 1992. The owner's father acquired the land from a coal and heating oil company in 1949. Diamond State Salvage operated a full scale salvage facility which consisted of removing metal from automobiles, appliances, and batteries. The metals were then shipped to several scrap metal buyers. Some materials, such as rubber and plastics, remained on site. Other materials were transported to the local landfill.

Field visits conducted by DNREC to the site and surrounding areas show that extensive contamination of the soils had occurred during the operational history. There is a reported odor of petroleum and turpentine coming from the soils, as well as a petroleum sheen on the surface water on site.

During 1991 and 1992, operations at Diamond State Salvage consisted mainly of excavating the ground surface of the site to locate any metals with salvage value. As a result of this excavation, over half of the site is covered with piles of earth mixed with large portions of debris and trash. Weathering effects over the past two years have formed deep ditches and pools along the edges of the debris piles.

Results from DNREC soil tests indicate elevated concentrations of lead (i.e. high value = 4360 ppm), polychlorinated biphenyls (PCBs) (i.e. high value = 58 ppm) and polycyclic aromatic hydrocarbons (PAHs) (i.e. high value = 21 ppm for benzo-a-pyrene).

On June 9, 1995, EPA TAT collected one surface water sample and eighteen soil/sediment samples from the areas indicated on the attached sample location map (See Map II). The samples have subsequently been analyzed by a contracted lab and have been reviewed by a TAT QA/QC officer. (See Data Attachments I, II & III).

VI. Information on Quality Assurance/Quality Control

Methodology

MATRIX	ANALYSIS	METHOD
SOIL	PP METALS	6010, except As 7060 Sb 7041 Se 7740 TI 7841 Hg 7471
SOIL	BNA (TCL Semivolatile Organics)/ Pesticides/PCBs	OLM01.8
SURFACE WATER	PP METALS	OLM01.8
SURFACE WATER	BNA/PCB/PEST	OLMO1.8

Analytical Review

See Analytical Review (Attachment V).

Sampling Locations

The basis for determining the sample locations was to obtain data needed to determine the extent of the on site and migrating contaminated soils. To accomplish this task, TAT retrieved nineteen surface soil (0-6") and sediment samples and one surface water sample from random points within the site boundaries. These locations were determined by the OSC and are depicted on the attached Site Sampling Map (See Map II).

HE OF SUBSTANCE

LEAD OXIDE

CAS REGISTRY NUMBER

1317-36-8

I'''FDIATELY DANGEROUS TO

ИD

TE OR HEALTH

ACCEPTABLE DAILY INTAKES

Tolerable intake of lead for preschool children should be less than the 3 mg/wk recommended provisionally for adults ... /Inorganic lead/ [WHO; Environ Health Criteria: Lead p.127 (1977)] **PEER REVIEWED**

ALLOWABLE TOLERANCES

ND

DEHA STANDARDS

OSHA Permissible Exposure Limit: 50 ug/cu m, 8 hr Time-Weighted Average. /Fumes and dusts, as Pb/ [29 CFR 1910.1025 (7/1/87)] **PEER REVIEWED**

ISHA STANDARDS

Meets criteria for OSHA medical records rule. /Inorganic lead/ [29 CFR 1910.20 (7/1/87)] **PEER REVIEWED**

WIOSH RECOMMENDATIONS

NIOSH Recommended Exposure Limit: <100 ug/cu m Time-Weighted Average; air level to be maintained so that worker blood lead remains less than or equal to 60 ug/100 g. Recommendations are based on exposures up to 10 hr. /Inorganic lead/ [NIOSH/CDC. NIOSH Recommendations for Occupational Safety and Health Standards Sept. 1986. (Supplement to Morpidity and Mortality Weekly Report 35 No. 15, Sept. 26, 1986) 215] **PEER REVIEWED**

THRESHOLD LIMIT VALUES

Time Weighted Avg (TWA) 0.15 mg/cu m (1936) /Lead inorganic dusts & fumes, as Pb/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American , p. 27] **UNREVIEWED**

THRESHOLD LIMIT VALUES

Excursion Limit Recommendation: Excursions in worker exposure levels may exceed three times the TLV-TWA for no more than a total of 30 min during a work day and under no circumstances should they exceed five times the TLV-TWA, provided that the TLV-TWA is not exceeded. /Lead inorganic dusts & fumes, as Pb/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American, p. 6] **UNREVIEWED**

THRESHOLD LIMIT VALUES

An identifiable population group might have an incr susceptibility to the effect of the chemical, thus leaving it unprotected by the recommended BEI. (1987-1988 adoption) /Lead/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American, p. 63] **UNREVIEWED**

THRESHOLD LIMIT VALUES

BEI (Biological Exposure Index): Lead in blood (timing is not critical) is 50 ug/100 ml. The determinant is usually present in a significant amt in biological specimens collected from subjects who have not been occupationally exposed. Such background levels are incl in the BEI value. (1987-1988 adoption) /Lead/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American, p. 63] **UNREVIEWED

THITSHOLD LIMIT VALUES

SEE Siblogical Exposure Index,: Lead in urine (timing is not oritical) is 150 ug/g creatinine. The determinant is usually present in a significant amt in biological specimens collected from subjects who have not been occupationally exposed. Such background levels are incl in the BEI value. (1987-1988 adoption) /Lead/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American b. 631 **UNRETIEWED**

THRESHOLD LIMIT VALUES

BEI (Biological Exposure Index): Zinc protoporphyrin in blood after 1 month exposure is 250 ug/100 ml erythrocytes or 100 ug/100 ml blood. The determinant is usually present in a significant amt in biological specimens collected from subjects who have not been occupationally exposed. Such background levels are incl in the BEI value. (1987-1988) adoption) /Lead/ [American Conference of Governmental Industrial Hygienists. Threshold Limit Values and Biological Exposure Indices for 1989-1990. Cincinnati, OH: American , p. 63] **UNREVIEWED**

THER OCCUPATIONAL

PERMISSIBLE LEVELS

WATER STANDARDS

... EPA is promulgating ... notification requirements for lead require public water systems to identify and provide notice to persons who may be affected by lead contamination in their drinking water, where such contamination results from the use of lead in the construction materials of the distribution system. There notification requirements, which apply to owners and operators of community and non-transient non-community water systems, apply in addition to the general public notification requirements for lead. /Lead ion/ [52 FR 41534 (10/28/87)] **PEER REVIEWED**

ER STANDARDS

Toxic pollutant designated pursuant to section 307(a)(1) of the Clean Water Act and is subject to effluent limitations. /Lead and inorganic and organic lead compounds/ [40 CFR 401.15 (7/1/87)] **PEER REVIEWED**

URIER STANDARDS

The maximum contaminant level (MCL) of lead as Pb ion in drinking water is 0.05 mg/l. /Lead as Pb icn/ [40 CFR 141.11 (7/1/87)] **PEER REVIEWED**

WATER STANDARDS

... Acute and chronic toxicity to salt water aquatic life occurs at concn as low as 668 and 25 ug/l, respectively. /Lead ion/ [USEPA; Ambient Water Quality Doc: Lead p.B-11 (1980) | **PEER REVIEWED**

ATMOSPHERIC STANDARDS

National primary and secondary ambient air quality standard for lead and its compounds, measured as elemental lead is: 1.5 ug/cu m, maximum arithmetic mean averaged over a calendar quarter. /Lead and its compounds, as Pb/ [40 CFR 50.12 (7/1/87)] **PEER REVIEWED**

SCIL STANDARDS

CERCLA REPORTABLE

QUANTITIES

TSCA REQUIREMENTS

ND

RCRA REQUIREMENTS

A solid waste containing lead oxide may become characterized as a hazardous waste when subjected to the Toxicant Extraction Procedure listed in 40 CFR 261.24, and if so characterized, must be managed as a hazardous waste. [40 CFR 261.24 (7/1/87)] **PEER REVIEWED**
RA REQUIREMENTS

The Environmental Protection Agency is ... /promulgated/ regulations concerning ground-water monitoring with regard to screening suspecte contamination at land based hazardous waste treatment, storage, and disposal facilities. ... There are/ new requirements to analyze for a specified core list of Chemicals plus those chemicals specified by the Regional Administrator on a site-specific basis. ... /Total lead (all species) is included on this list.//Total lead (all species)/ [52 FR 25942 (7/9/87)] **PEER REVIEWED**

FIFRA REQUIREMENTS NI

FDA REQUIREMENTS

Bottled water shall, when a composite of analytical units of equal volume from a sample is examined by the methods described in paragraph (d)(1)(ii) of this section, meet the standards of chemical quality and shall not contain lead as Pb ion in excess of 0.05 mg/l. /Lead as Pb ion/ [21 CFR 103.35 (4/1/36)] **PEER REVIEWED**

FDA REQUIREMENTS

The FDA action level of lead is 7.0 ug/ml of leaching soln for pottery (ceramics) flatware (avg of 6 units); 5.0 ug/ml of leaching soln for small hollowware (any one of 6 units); 2.5 ug/ml of leaching soln for large hollowware (any one of 6 units); 7.0 ug/ml of leaching soln if product intended for use by adults for silver-plated hollowware (avg of 6 units); and 0.5 ug/ml of leaching soln if product intended for use by infants and children for silver-plated hollowware (one or more of 6 units). /Inorganic lead/ [FDA; Action Levels for Poisonous or Deleterious Substances in Human Food and Animal Feed p.9 (1982)] **PEER REVIEWED**

ST PLING PROCEDURES

Analyte: Lead; Matrix: Air; Sampler: Filter (0.8-um cellulose ester membrane); Flow rate: 1 to 4 l/min; Vol: min: 200 l @ 0.05 mg/cu m, max: 1200 l; Stability: stable. /Lead and lead cmpd/ [U.S. Department of Health and Human Services, Public Health Service. Centers for Disease Control, National Institute for Occupational Safety and Health. NIOSH V2 7082-1] **PEER REVIEWED**

SAMPLING PROCEDURES

Analyte: Lead; Specimen: Blood or tissue; Vol: 10 ml blood, or 1 g tissue; Preservative: Heparin for blood, none for tissue; Controls: collect 3 blood specimens from unexposed workers; Stability: not established. /Lead and lead cmpd/ [U.S. Department of Health and Human Services, Public Health Service. Centers for Disease Control, National Institute for Occupational Safety and Health. NIOSH V1 8005-1] **PEER REVIEWED**

SAMPLING PROCEDURES

Analyte: Lead; Specimen: whole blood, urine; Preservative: (urine) 0.2 ml conc nitric acid; Anticoagulant: (blood) heparin; Controls: commercial urine and blood lead control samples plus pooled urine and blood from non-exposed populations; Stability: (blood) 3 days @ 4 deg C, indefinitely if sonicated and frozen in plastic tubes, (urine) indefinitely if kept acidified with nitric acid. /Lead and lead cmpd/[U.S. Department of Health and Human Services, Public Health Service. Centers for Disease Control, National Institute for Occupational Safety and Health. MIOSH V1 8003-1] **PEER REVIEWED**

S' PLING PROCEDURES

lead dust or fume is collected on 0.45 micrometer cellulose memorane filters mounted in either 2- or 3-piece filter cassettes. Air is drawn through the filter by means of a pump at a rate of 2 1/min (not less than 1 nor more than 4 1/min). A minimum sample of 100 liters small be collected. Larger sample volumes are encouraged, provided the filters do not become loaded with dust to the point that loose material would fall off or the filters would become clogged. With each group of samples, one filter, labeled as a blank, shall be submitted and no air shall be drawn through this filter. /Lead and lead cmpd/ (NIOSH; Criteria Document: Inorganic Lead p.VII-1 (1978) DHEW Pub. NIOSH 73-158] **PEER REVIEWED**

SAMPLING PROCEDURES

TWO AUTOMATIC SAMPLING APPARATUS BASED ON THE BETA RAY ABSORPTION AND ON THE TYNDALL EFFECTS ARE DESCRIBED. (204)PB DUSTS WERE MEASURED. /LEAD AND LEAD CMPD/ [CECCHETTI G ET AL; ANN INST SUPER SANITA 13 (1-2): 103 (1977)] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

Air: Analysis by atomic absorption spectroscopy using an air acetylene flame. The method has a typical range of 0.07 - 7.5 ug Pb/cu m. Water: atomic absorption spectroscopy, optimum concn range for the 283.3 nm absorption is 1-20 mg/l with an estimated detection limit of 0.1 mg/l./Total lead/ [USEPA; Intermedia Priority Pollutant Guidance Document: Lead p.9-1 (1982)] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

Analysis of lead in water is typically accomplished with atomic absorption and emission spectroscopy... It is commonly necessary to concentrate the sample by chelating and extracting the lead or by evaporating the water, since the natural lead content of lakes and rivers is in the range of 1 to 10 ug/l. /Total lead/ [USEPA; Air Quality Criteria for Lead p.4-5 (1977) EPA 600/8-77-017] **PEER REVIEWED**

RNALYTIC LABORATORY METHODS

Water: colorimetric method using dithizone. Analytical range is 1.0-30.0 ug Pb. Water: differential pulse anodic stripping voltammetry method. Limit of detection is 0.001 mg/l/. Can be used to detect levels up to 0.1 mg/l. /Total lead/ [USEPA; Intermedia Priority Pollutant Guidance Document: Lead p.9-2 (1982)] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

AIR SAMPLES OF LEAD OR INORGANIC LEAD COMPOUNDS ARE DETERMINED BY ATOMIC ABSORPTION SPECTROPHOTOMETRY; PROCEDURE: FILTER COLLECTION, NITRIC ACID DIGESTION. RANGE: 0.128 TO 0.399 MG/CU M WITH COEFFICIENT OF VARIATION OF 0.072 FOR TOTAL ANALYTICAL & SAMPLING METHOD. THIS VALUE CORRESPONDS TO 0.014 MG/CU M STD DEVIATION AT OSHA STD LEVEL OF 0.2 MG/CU M. /TOTAL LEAD/ [U.S. Department of Health, Education Welfare, Public Health Service. Center for Disease Control, National Institute for Occupational Safety Health. NIOSH Manual of V3 S341+1] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

MATRIX: AIR; RANGE: 42-840 UG/CU M; PROCEDURE: FILTER COLLECTION, ACID DIGESTION, ATOMIC ABSORPTION SPECTROPHOTOMETRY. /TOTAL LEAD/ [U.S. Department of Health, Education Welfare, Public Health Service. Center for Disease Control, National Institute for Occupational Safety Health. NIOSH Manual of V5 173-1] **PEER REVIEWED**

3 LYTIC LABORATORY METHODS

Analyte: lead. Matrix: air. Procedure: Atomic absorption, flame (air-acetylane, oxidizing). Wavelength: 283.3 nm. Range: 10 to 200 ug/sample. Precision: 0.03. The working range is 0.025 to 0.5 mg/cu m for a 400 l air sample. The method is applicable to elemental lead, including lead fume, & all other aerosols containing lead. This is an elemental analysis, not compound specific. Interferences: Use D2 or H2 continuum background correction to control flame or molecular absorption. High concentrations of calcium, sulfate, carbonate, phosphate, iodide, fluoride, or acetate can be corrected. /Total lead/[U.S. Department of Health and Human Services, Public Health Service. Centers for Disease Control, National Institute for Occupational Safety and Health. NIOSH V2 7082-1] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

Analyte: lead; matrix: air; procedure: filter collection, acid digestion, inductively coupled plasma-atomic emission spectroscopy; detection limit: 17 ng/l. /Total lead/ [U.S. Department of Health, Education Welfare, Public Health Service. Center for Disease Control, National Institute for Occupational Safety Health. NIOSH Manual of V7 351-1] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

METHOD FOR DETERMINATION OF LEAD (PB) IN FOOD PRODUCTS (GRAIN PRODUCTS, FRUIT JUICE, MEAT, & VEGETABLES) INVOLVES CO-PRECIPITATION OF PB WITH STRONTIUM SULFATE, CONVERSION TO CARBONATE, DISSOLUTION IN MITRIC ACID, & DETERMINATION BY ATOMIC ABSORPTION SPECTROTOMETRY. /TOTAL LEAD/[HOOVER WL; J ASSOC OFF ANAL CHEM 55 (4): 737-(1972)] **PEER REVIEWED**

ANALYTIC LABORATORY METHODS

DETERMINATION OF LEAD IN FOOD SAMPLE BY ANODIC STRIPPING VOLTAMMETRY.

/TOTAL LEAD/ [HOLAK W; J ASSOC OFF ANAL CHEM 63 (3): 485 (1930)] **PEER

REVIEWED**

A. LYTIC LABORATORY METHODS

DETERMINATION OF LEAD IN CEREAL & GRASS SAMPLES BY FLAMELESS ATOMIC ABSORPTION SPECTROSCOPY. /IOTAL LEAD/ [HORAK O; LANDWIRTSCH FORSCH 29 (3-4): 289 (1976)] **PEER REVIEWED**

CLINICAL LABORATORY METHODS

... A simplified method for estimating urinary coproporphyrin as a lead exposure index /was developed/. Samples are acidified with acetic acid and coproporphyrin is extracted into ether. The ether extract is shaken with an iodine-hydrochloric acid solution which oxidizes any coproporphyrinogen to coproporphyrin. Concn is measured by absorbance at the Soret band peak (ca 401 nm). /Total lead/ [NIOSH; Criteria Document: Inorganic Lead p.XI-29 (1978) DHEW Pub. NIOSH 78-158] **PEER REVIEWED**

CLINICAL LABORATORY METHODS

MICRODETERMINATION OF LEAD IN BLOOD & URINE BY ANODIC STRIPPING VOLTAMMETRY EQUIPPED WITH MERCURY ELECTRODE. NO INTERFERENCE WAS FOUND WITH COEXISTING IONS FOUND IN URINE. /TOTAL LEAD/ [KARAI I ET AL; OSAKA CITY MED J 25 (1): 39-46 (1981)] **PEER REVIEWED**

CLINICAL LABORATORY METHODS

High performance liquid chromatography assay of RBC UMPase activity is a sensitive and rapid assay that appears to meet criteria for a reliable clinical laboratory index of blood lead concentrations. /Total lead/ [Cook LR et al; Br J Ind Med 43: 387-90 (1986)] **PEER REVIEWED** INICAL LABORATORY METHODS

Biological indicator of expoure to lead or lead compounds. Analyte:

Lead. Matrix: blood or tissue. Method: Inductively-coupled argon plasma-atomic emission spectroscopy. Wavelength: 220.4 nm. Precision: 0.85. This method is useful for monitoring the blood of workers exposed to several metals simultaneously. This is a simultaneous multielemental analysis, but is not compound-specific. /Total lead/ [U.S. Department of Health and Human Services, Public Health Service. Centers for Disease Control, National Institute for Occupational Safety and Health. NIOSH VI 8005-1] **PEER REVIEWED**

CLINICAL LABORATORY METHODS

Biological indicator of expoure to lead & lead compounds. Analyte:
Lead(II)-APDC (ammonium pyrrolidine dithiocarbamate) complex. Matrix:
blood or urine. Technique: atomic absorption, air/acetylene. Quality
control: commercial controls, pooled urine or blood, urine corrected
for creatinine. Extraction: APDC-MIBK (methyl isobutyl ketone). Range:
5 to 150 ug/100 g blood; 5 to 150 ug/100 ml urine. Precision: 0.05.
This procedure quantitates Pb(2+) in blood or urine to assess body
burden, injury to the hematopoietic system, & to comply with Federal
regulations. Blood lead is the preferred bilogical indicator of lead
absorption. The optimum working range is 0.1 to 1.5 ug Pb/g or per ml
urine. Interferences: Phosphate, EDTA, & oxalate can sequester lead and
cause low lead readings. /Total lead/ [U.S. Department of Health and
Human Services, Public Health Service. Centers for Disease Control,
National Institute for Occupational Safety and Health. NIOSH V1 8003-1]
PEER REVIEWED

CLINICAL LABORATORY METHODS

Lead analyses of skeletal biopsies obtained from vertebrae of active and retired lead workers and the in vivo x-ray fluorescence (XRF) analysis of lead in fingerbone were determined. The types of lead exposure were smelter workers, brass founders, scrapping of red-leaded goods, storage battery plant worker, plastic factory worker using lead stearate, and spray painter using red lead oxide. /Incrganic lead compounds/ [Schutz A et al; Arch Environ Health 42 (6): 340-6 (1987)] **PEER REVIEWED**

Divalent lead has a strong affinity for inorganic ions containing oxygen (eg, carbonate) or sulfur (sulfide). Lead can also complex with electron rich ligands in many organic cmpd such as amino acids, proteins, and humic acid. /Inorganic lead/ [Kayser, R., D. Sterling, D. Viviani (eds.). Intermedia Priority Pollutant Guidance Documents. Washington, DC: U.S. Environmental Protection Agency, July 1982. 1-1] **PEER REVIEWED**

GENERAL DESCRIPTION:

Polychlorinated biphenols is a clear light colored liquid. In this solution it poses little acute health hazards to humans. However it may cause considerable damage to the environment unless properly cleaned up and debris correctly disposed of. ((c) AAR, 1991) Ya

FIRE & EXPLOSIVE HAZARD:

Combustible. Irritating gases are generated in fires. (USCG, 1991) #

FIRE FIGHTING:

Extinguish fire using agent suitable for type of surrounding fire (material itself does not burn or burns with difficulty). Keep run-off water out of sewers and water sources. ((c) AAR, 1991) 7

PROTECTIVE CLOTHING AND SUIT MATERIAL COMPATIBILITY (ACGIN 1985:)

Wear appropriate equipment to prevent any possibility of skin contact. Wear eye protection to prevent reasonable probability of eye contact. Workers should wash immediately when skin becomes contaminated.

nge: No recommendation applies to this category.

move clothing promptly if it is non-impervious clothing that becomes

wet. (NIOSH, 1990)

NONFIRE RESPONSE:

Keep material out of water sources and sewers. Build dikes to contain flow as necessary. Attempt to stop leak if without undue personnel h= ard. ((c) AAR, 1991)

HEALTH HAZARDS:

LIQUID OR SOLID: Irritating to skin and eyes. (USCG, 1991)

FIRST AID:

Ir this chemical contacts the eyes, immediately wash the eyes with large amounts of water, occasionally lifting the lower and upper lids. Get medical attention immediately. Contact lenses should not be worn when working with this chemical. If this chemical contacts the skin, immediately wash the contaminated skin with soap and water. If this chemical penetrates the clothing, immediately remove the clothing, wash the skin with soap and water, and get medical attention promptly. If a person breathes large amounts of this chemical, move the exposed person to fresh air at once. If breathing has stopped, perform mouth-to-mouth resuscitation. Keep the affected person warm and at rest. Get medical attention as soon as possible. If this chemical has been swallowed, get medical attention immediately. (NIOSH, 1990) BQ

SUBJECT:

Diamond State Sample Analytical Review

DATE:

August 16, 1995

This report covers the general review of the data package submitted by Laboratory Resources, Inc., for one (1) water sample and nineteen (19) soil samples collected at the Diamond State Site on June 9, 1995. The sample was received at Laboratory Resources, Inc., in Teterboro, NJ on June 13, 1995. The analyses requested were base-neutral and acid extractables (BNA), pesticide/PCBs and target analyte list (TAL) metals.

ANALYTICAL METHODOLOGY

The samples were analyzed for BNAs by EPA Method 8270, for pesticide/PCBs by EPA Method 8080 and for TAL metals in accordance with EPA Contract Laboratory Program (CLP) Statement of Work ILM03.0.

- Signed chain-of-custody records were received.
- The BNA GC/MS tune data and internal standard data met criteria. The BNA initial and continuing calibration data did not meet criteria for all compounds, however, since none of the compounds were detected, no data was qualified. The hold times were met. The method blank contained phenol at 280 ug/Kg. Samples S6, S12, S13, S15 and S18 should be considered not detected for phenol since they were less than five times the blank concentration. The surrogate spike recoveries, matrix spike/matrix spike duplicate (MS/MSD) recoveries and relative percent difference (RPD) values met criteria.

AR000030

Diamond State Analytical Review August 16, 1995
Page 2 of 2

- The pesticide/PCB initial and continuing calibration data met criteria. The hold times were met. The method blanks were free of contamination. The MS/MSD recoveries, surrogate spike recoveries and RPD values were not calculated because the spikes were diluted out. All hits were confirmed on a second column and met criteria.
- The TAL metals data met criteria. The hold times were met. The method blank for the water sample contained aluminum at 159 ug/L. The aluminum value for sample AQ1 should be considered not detected. The method blank for the soil samples contained sodium at 321 ug/L. sodium result for sample SJ should be considered not detected. Some MS recoveries and RPD values did not meet criteria. The soil spikes for antimony, arsenic, nickel and selenium were low, therefore, the results for antimony, arsenic, nickel and selenium should be considered biased low. The RPD value for mercury for the soil samples did not meet criteria, therefore, the mercury results for the soil samples should be considered approximate. The serial dilution for lead the soil samples did not meet criteria, therefore, the lead results for the soil samples should be considered approximate.

CONCLUSION

Accept all pesticide/PCB as presented. Use the original run for all pesticide/PCBs except for samples S5 and S6. Use S5DL and S6DL since the original analysis was above the linear range. Accept all BNA results with the following exception; samples S6, S12, S13, S15 and S18 should be considered not detected for phenol due to blank contamination. Accept the metals results with the following exceptions: The antimony, arsenic, nickel and selenium results for the soil samples should be considered biased low due to low spike recoveries. The mercury results for the soil samples should be considered approximate due to RPD values not meeting criteria. The lead soil results should be considered approximate since the serial dilution did not meet criteria. The aluminum result for sample AQ1 and the sodium result for sample S3 should be considered not detected due to blank contamination.
